Alex Morgan

Full-stack developer. Thoughtful problem solver.

FICTIONAL CANDIDATE - SYNTHETIC EVIDENCE

Session: d4ae6367-2de6-4ed1-90cb-f9037f4f0aed
Started: 2026-10-30T10:04:53.616Z (UTC)
Ended: 2026-10-30T10:05:16.913Z (UTC)
Profile revision: synthetic-demo-v1

Interview overview

3 recorded questions. This brief compiles the session’s checked AI answers and source references. It does not independently verify employment, authorship, competence, or hiring suitability.

Topics discussed

Backend APIs (1 recorded turn) | Databases (2 recorded turns) | Authentication (1 recorded turn) | Education & experience (1 recorded turn) | Architecture & projects (3 recorded turns) | Testing (1 recorded turn) | Deployment (2 recorded turns)

Technical skills mentioned

PostgreSQL (2 turns), Prisma (2 turns), Kubernetes (1 turn)

Mention counts describe the conversation, including unsupported questions. They do not establish skill proficiency.

Questions asked

1. How does the sample Taskflow project use PostgreSQL and Prisma?
2. Can you expand on that project’s database choices and what the evidence establishes?
3. Does the available evidence establish production Kubernetes administration experience?

Evidence-supported experience discussed

The Taskflow project utilizes PostgreSQL as its database, managed through Prisma. The schema incorporates User, Workspace, Membership, and Task models that are linked via foreign-key relationships, and it employs transactions for task creation and assignment operations. [1]

The Taskflow project uses PostgreSQL as its database, with Prisma serving as the ORM. The data structure is defined by User, Workspace, Membership, and Task models, which are connected through foreign-key relationships. Additionally, the implementation uses transactions to handle task creation and assignment operations. [1]

The project's API implementation for task creation includes input validation using Zod and verifies workspace membership via a session. The code includes logic for role-based checks, specifically distinguishing between owners and members. [2]

Areas that remain unverified

1. Specific performance metrics or query optimization strategies used within the Taskflow database layer.

2. The rationale for selecting PostgreSQL over other database solutions for this project.

3. Evidence of production-scale testing or security audits for the Taskflow database implementation.

4. The provided evidence does not contain any information regarding Kubernetes administration experience.

5. There is no mention of container orchestration or infrastructure management in the candidate's resume or project documentation.

Suggested follow-up checklist

1. For the question “Can you expand on that project’s database choices and what the evidence establishes?”, ask the candidate for a project, source, or concrete example that clarifies: “Specific performance metrics or query optimization strategies used within the Taskflow database layer.”.

2. For the question “Does the available evidence establish production Kubernetes administration experience?”, ask the candidate for a project, source, or concrete example that clarifies: “The provided evidence does not contain any information regarding Kubernetes administration experience.”.

Useful next steps

Review the referenced material with the candidate. Ask them to explain their personal contribution, reproduce relevant technical decisions, and clarify the unresolved areas. This brief provides interview context, not a candidate ranking.

Supporting sources

[1] Taskflow · sample schema

Provenance: Synthetic repository excerpt

Quote: Synthetic schema summary: PostgreSQL through Prisma. User, Workspace, Membership and Task models use foreign-key relationships; task creation and assignment are wrapped in a transaction.

[2] Taskflow · sample API source

Provenance: Synthetic repository excerpt

Quote: Synthetic source summary: POST /api/tasks validates input with Zod and checks workspace membership using a session. The author describes role checks for owner and member. No security audit or production deployment is established.
